

# Switching to a Time of Use plan

## How adjusting your usage can save you money

One of the biggest impacts you can have on your energy bill is a time of use plan, paired with mindful usage. If you were to switch from a flat rate to a time of use plan, you could pay less while using the same amount of electricity simply by taking advantage of off-peak times with your new plan.

Charge	Units	\$ per unit	Total
Flat rate	200 kWh	\$0.37	\$74.00
<b>vs.</b>			
Time of Use	200 kWh	--	\$70.00
Peak	50 kWh	\$0.59	\$29.50
Off-peak	150 kWh	\$0.27	\$40.50

Example pricing based on AGL's standing offer (including GST).  
Retail rates from 1 July 2024.

**Total potential  
monthly savings  
\$4.00**

## Making use of a smart meter

A smart meter installed on your home gives you access to time of use electricity plans.

It can even help you track your usage, to help you take advantage of off-peak pricing.

## Here are some ways you could move your usage

- ✓ Make use of the delay start function on dishwashers and washing machines.
- ✓ Charge devices in off-peak periods and unplug any on standby during peak.

## Optimise your energy usage

By incorporating simple actions into your daily routine, you can reduce energy wastage and contribute to a more sustainable future. Appliances still use electricity when on standby, which can account for more than 10% of your electricity use. Be mindful of your electricity use - small changes add up!

- ✓ Turn off lights when not in use.
- ✓ Unplug chargers when devices are fully charged
- ✓ Use fans instead of air conditioning when possible.
- ✓ Wash clothes in cold water.
- ✓ Choose energy efficient appliances.
- ✓ Set air conditioning to an energy efficient temperature (18-21 in Summer and 23-26 in Winter).
